

WHAT IS CLAIMED IS:

1. A method of separating and processing a catalyst carrier that is contained in a processing
5 object that includes a catalyst carrier metal cover to which an exhaust gas pipe is still connected, and magnetic carrier foil or a ceramic carrier, a surface-enlarging coating film provided on the magnetic carrier foil or the ceramic carrier, and the catalyst carrier
10 containing precious metal,

the method comprising the steps of:

crushing the catalyst carrier and the metal cover to which the exhaust gas pipe is still connected, using a first crusher of a shearing type;

15 breaking the catalyst carrier containing precious metal from the metal cover, using an impact-type pulverizer; and

separating the catalyst carrier containing precious metal from the exhaust gas pipe and the metal
20 cover, using a separator.

2. The method as claimed in claim 1, further comprising the steps of:

pulverizing a metallic catalyst carrier
25 containing precious metal, using a second crusher, the pulverizing being carried out after the separating step using the separator; and

dividing fragments and particulate matters containing the precious metal into a precious metal
30 concentrate and catalyst carrier pieces not containing a great amount of the precious metal.

3. The method as claimed in claim 1, wherein the separator is a pneumatic separator.

35

4. The method as claimed in claim 1, wherein the separator is a sieving separator.

5. The method as claimed in claim 1, further comprising the steps of:

dividing the catalyst carrier containing precious
5 metal that have been separated by the separator into
magnetic matters and nonmagnetic matters, using a
magnetic separator; and

pulverizing the magnetic matters, using a second
crusher.
